# Ticket Screening Services

Eliminate Unnecessary Site Visits

Utilizing state of the art ticket screening software, On Target has customized a ticket screening program that will save you money. On Target screening customers consistently see 20 – 25% reduction in dig site visits because of the dedicated staff and investment in technology. On Target works closely with each screening customer to predetermine clearing buffers and mapping requirements. After initial set up the mapping team at On Target maintains customer maps each time an update is sent. This, along with the smaller buffers, enables the On Target screening department to screen out more tickets then other system maps. Further more, each screener is equipped with dual wide screen monitors to enable quantity and quality when screening tickets.

Screened tickets are saved in a historical database much like an executed ticket. Computer screen captures of the integrated maps used to clear the ticket are attached to the record. Pre-formatted clear to dig notice contact is made with the contractor via e-mail, fax or letter. On Target's system automatically sends this positive response notice without the need for human interaction.

All this means you save money! Let us take a look at your maps today.
